

Why Choose Manufacturer Original Supplies?

- It is true that original cartridges cost more than remanufactured products. However when you consider additional costs which occur with remanufactured cartridges because of low reliability, poor quality and fewer printed pages, original supplies are more economical.
- Remanufactured cartridges have inconsistent productivity and yield. That means that the yield quoted in the specifications is often not the true number of printed pages that you will be able to print out.
- The use of lesser-quality toners not only impact print quality but the consequences can be extremely severe: the rollers or other system parts can be contaminated with coarser or lumpy toner, for example, so that in the worst case irreparable damage is caused. If this happens you will have to bear the cost yourself, as the manufacturer's guarantee only extends to original consumables purchased from authorised dealers.
- Non-Original consumables can result in poor quality printing or defective print-outs than original cartridges and these printouts are not durable. As a result you have to spend your time and money on reprints.
- Using non-Original consumables may also invalidate your printer warranty or service agreement, as the manufacturer's guarantee only extends to original consumables purchased from authorised dealers. This way just one cheap purchase can become an expensive business.
- Save on your printing costs by using high-yield toner cartridges, twin packs and rainbow kits with higher page yield, reduced cost per page and increase productivity.
